(Z. Naturforsch. 30a, 855—867 [1975] ; received December 16, 1974)

Macroscopic slip velocity, macroscopic temperature jump, thermal creep velocity and diffusion slip velocity for a mixture of monatomic gases are calculated by using a method developed recently (modified Maxwell-method) for a general gas-gas and gas-surface interaction law, and for a possibly anisotropic surface. The results are expressed in terms of accommodation coefficients of first and second order. Specialization is made for a binary gas mixture. For a comparison the results obtained by Maxwell's original method and general surface accommodation are given. In the case of surface-anisotropy several new slip effects occur.

I. Introduction

Since 1967 variational methods are used in the treatment of slip problems by solving the linearized Boltzmann equation within the Knudsen layer. Without special assumptions on the gas-gas intermolecular force law or the gas-surface interaction law Loyalka derived simple and accurate expressions for the velocity slip coefficient, the slip velocity in the thermal creep and the temperature jump coefficient for a simple gas, and for the velocity slip and the temperature jump coefficient for a multicomponent gas mixture, as well as for the diffusion slip velocity in a gas mixture. In a further paper Loyalka rederived his results for the velocity slip and for the temperature jump coefficient of a simple gas with an approximation method, namely by a simple modification of Maxwell's assumption on the velocity distribution of the gas molecules impinging on the wall. This method, shortly denoted by "modified Maxwell-method", is also used by Lang and Loyalka rederiving the expression for the diffusion slip velocity of a binary gas mixture. The final results of Loyalka are presented in terms of scalar products involving the pertinent Chapman-Enskog solution and an operator containing the effects of gas-wall interactions.

Kline and Kuscer also derived equations for the velocity and the temperature slip coefficients for a simple monatomic gas and a general gas-surface scattering law by a variational method.

Moreover, they have solved the equations for the Chapman-Enskog solutions with a variational approximation and represented the results for the slip coefficients in terms of a set of accommodation coefficients. As recently was shown, these results are in agreement with those gained by introducing the accommodation coefficients into the corresponding final expressions of Loyalka, and taking into account the first order terms in the development of the Chapman-Enskog solutions with respect to Sonine's polynomials.

In the present paper at first the results of Loyalka and an expression for the thermal creep velocity for multicomponent gas mixtures are derived with the modified Maxwell-method. Generalization is given for anisotropy of the surface. The particular slip effects are not treated separately, but it is assumed that far from the surface there exists a mass flow (in y-direction parallel to the surface) as well as a temperature gradient (with x-, y- and z-components). If the surface is anisotropic a number of new slip effects occurs, for instance a change of the slip velocity caused by a temperature jump, and conversely ("crossing"-slip-effects). Even if the surface is invariant with respect to rotations through 180° about the surface normal, but not completely isotropic, there appears a change of the thermal creep velocity and the diffusion slip velocity due to the z-component of the temperature gradient (whereas the mass flow has y-direction). Furtheron, the accommodation coefficients are introduced, which are certain moments of the scattering
operator $A$ and characterize certain aspects of the gas-surface interaction in a compressed form. All expressions are compared with those obtained by applying Maxwell’s original assumption concerning the velocity distribution of the incident gas particles. Finally, the results are specialized to the case of a binary gas mixture.

In this connection it should also be referred to the papers of Cipolla, Lang and Loyalka, who calculated the temperature and pressure jumps during evaporation and condensation of a simple gas assuming a special gas-liquid surface scattering law (with a variational method) and for general gas-liquid surface interaction, as well as for a multi-component gas mixture (with the modified Maxwell-method).

II. Formulation of Equations

A multicomponent mixture of monatomic gases is considered, occupying the half space $x > 0$ and bounded by a flat plate located at $x = 0$. The starting point of the analysis is the steady Boltzmann-equation for the $i$-th constituent distribution function $f_i (i = 1, \ldots, N)$ of an $N$-component gas mixture. For small deviations from equilibrium this equation may be linearized by introducing the relative perturbation $\delta_i(r, c)$ of the distribution function $f_i$ with respect to an absolute Maxwellian $f_{i0}$ through the definitions

$$f_i = f_{i0}(1 + \Phi_i) ,$$

$$f_{i0} = n_{i0} \left( \frac{m_i}{2\pi k T_0} \right)^{3/2} \exp \left\{ - \frac{m_i}{2k T_0} c^2 \right\} ,$$

where $r$ is the position vector, $c$ the velocity, $m_i$ the mass of an $i$-molecule, $n_{i0}$ the density $n_i$ of the $i$-th component at $r = 0$, $k$ Boltzmann’s constant, and $T_0$ the surface temperature at $r = 0$.

Introducing (1), (2) into Boltzmann’s equation and neglecting terms of higher than linear order leads to the linearized Boltzmann-equation

$$c \cdot \Delta \Phi_i / \Delta r = L(\Phi_i) ,$$

where

$$L[\Phi_i(c)] = \sum_{j=1, \ldots, N} \int f_{j0}(\bar{c}) \left[ \Phi_j(c') + \Phi_j(\bar{c}) \right]$$

$$- \Phi_i(c) - \Phi_j(c') \right| \bar{c} - c \mid b \, db \, dc \, d\bar{c} .$$

The linear collision operator $L$ is Hermitian,

$$[f_i, L(g_i)] = [L(f_i), g_i]$$

with respect to the inner product

$$[f_i, g_i] = \int f_{i0} h_i g_i \, dc ,$$

where $f_i$ and $g_i$ are arbitrary (square-integrable) functions of $c$.

As a consequence of properties of $L$ the macroscopic conservation relations take (correct to first order terms) the form, that the divergence of the following quantities vanishes.

$$n_{i0} u_i = \int f_{i0} \Phi_i(r, c) \, dc ,$$

$$n_0 u = \sum_i n_{i0} u_i = [c_i, \Phi_i(r, c)] ,$$

$$q_0 q = \sum_i m_i n_{i0} u_i = [m_i c_i, \Phi_i(r, c)] ,$$

$$P = p_0 I + [m_i c_i, \Phi_i(r, c)] ,$$

$$Q_T = \frac{m_i}{2} \left[ c^2 c_i, \Phi_i(r, c) \right] .$$

In these equations $u_i$ is the mean particle velocity of component $i$, $u$ is the mean particle velocity of the mixture, $q$ is the mass velocity of the mixture, $P$ is the pressure tensor, and $Q_T$ the total flux of kinetic energy in the mixture. Total particle density, mass density of the $i$-th component, and mass density of the mixture are

$$n_0 = \sum_i n_{i0} ,$$

$$q_0 = \sum_i q_{i0} ,$$

the hydrostatic pressure is

$$p_0 = \sum_i p_{i0} + n_0 k T_0 .$$

$I$ denotes the second-order unit tensor.

The conductive heat transfer $Q'_c$ measured with respect to the velocity $u$ is given by

$$\frac{Q'_c}{k T_0} = \frac{Q_T}{k T_0} - \frac{5}{2} \frac{n_0 u}{m_i c_i} \left[ \frac{m_i c_i^2}{2k T_0} - \frac{5}{2} \right] c_i, \Phi_i(r, c) \right] .$$

Thus, it is seen that in this steady, linear problem all mass and energy flows have vanishing divergence.

III. Boundary Condition

The boundary condition for $\Phi_i$ is formulated with the gas-surface scattering kernel $P_i (c' \to c)$ and the scattering operator $A_i$. $P_i (c' \to c)$ is the probability density that, if a gas particle of the $i$-th kind hits the surface at a certain point with the
velocity \( \mathbf{c}' \), this or another gas particle of the \( i \)-th kind leaves the surface at nearly the same time and point with the velocity \( \mathbf{c} \) within the velocity space element \( d\mathbf{c} \). Therefore, \( P_i \) fulfills the equation

\[
c_x f_i(\mathbf{c}) = \int c'_x f_i(\mathbf{c}') P_i(\mathbf{c}' \rightarrow \mathbf{c}) \, d\mathbf{c}' (c_x > 0) \quad (10)
\]

A subscript - (or +) with the integral sign indicates that the integration is taken over the half-space \( c_x < 0 \) (or \( > 0 \)). Equation (10) represents the boundary condition for the distribution function \( f_i \). \( P_i \) depends on the properties of the gas and the wall (especially of the local temperature of the wall). As a probability density \( P_i \) is non-negative, and normalized

\[
\int P_i(\mathbf{c}' \rightarrow \mathbf{c}) \, d\mathbf{c} = 1 \quad (c_x < 0)
\]

since adsorption, evaporation and condensation phenomena are not considered here. All gas-surface scattering kernels satisfy the reciprocity relation \( 16-18 \). Written with dimensionless velocities

\[
\mathbf{v}^{(r)} = \sqrt{m_i/2 k T_0} \mathbf{c}^{(r)}
\]

the reciprocity relation at \( r = 0 \) runs

\[
|v_x'| e^{-v_x^2} P_i(\mathbf{v}' \rightarrow \mathbf{v}) = v_x e^{-v_x^2} P_i (-\mathbf{v} \rightarrow -\mathbf{v}') \quad (v_x > 0, v_x' < 0) \quad (12)
\]

Substituting (1), (2) into the boundary condition (10) at \( r = 0 \) and applying Eqs. (11, 12) it results

\[
\Phi_i(r = 0, \mathbf{c}) = A_i \Phi_i(r = 0, \mathbf{c}) (c_x > 0)
\]

where \( A_i \) is the scattering operator given by

\[
A_i \Phi_i(0, \mathbf{c}) = \int f_{00}(c') |c'_x| P_i(\mathbf{c}' \rightarrow \mathbf{c}) \Phi_i(0, \mathbf{c}') \, d\mathbf{c}' \quad (c_x > 0)
\]

### IV. The Asymptotic Distribution

To complete the formulation of the problem it is necessary to specify the form of the distribution \( f_i \) in the region far from the surface. In that region \( (x \rightarrow \infty) \) \( f_i \) is given by the Chapman-Enskog solutions as

\[
f_{i, \text{asy}} = f_{i}^{(0)} (1 + \Phi_i^{(1)})
\]

where \( f_{i}^{(0)} \) is the local Maxwellian

\[
f_{i}^{(0)} = n_{i, \text{asy}}(r) \left( \frac{m_i}{2 \pi k T_{\text{asy}}(r)} \right)^{3/2} \exp \left\{ - \frac{m_i (\mathbf{c} - \mathbf{q}_{\text{asy}}(r))^2}{2 k T_{\text{asy}}(r)} \right\}
\]

and \( \Phi_i^{(1)} \) is given in \( 15 \). In (16) \( T(r) \) is the temperature, \( \mathbf{q}(r) \) the mass velocity of the gas mixture, and the subscript "asy" refers to the asymptotic continuum region.

For small deviations from equilibrium linearizing is justified and leads [with Eqs. (1) and (15)] to

\[
f_{i, \text{asy}}(r, \mathbf{c}) = f_{i0} [1 + \Phi_{i, \text{asy}}(r, \mathbf{c})]
\]

where

\[
\Phi_{i, \text{asy}}(r, \mathbf{c}) = \Phi_{i, \text{asy}}^{(0)} + \Phi_{i, \text{asy}}^{(1)}(r, \mathbf{c})
\]

and

\[
g_i(r, \mathbf{c}) = \frac{p_{i, \text{asy}}(r) - p_{i0}}{p_{i0}} + \left( \frac{m_i c^2}{2 k T_{\text{asy}}(r)} - \frac{5}{2} \right) \frac{T_{\text{asy}}(r) - T_0}{T_0} + \frac{m_i}{k T_0} \mathbf{q}_{\text{asy}}(r) \cdot \mathbf{c}
\]

\[
\Phi_{i, \text{asy}}^{(1)}(r, \mathbf{c}) = -\frac{1}{n_0} \sum_j \alpha_{ij} \mathbf{c} \cdot \mathbf{d}_j - \frac{1}{n_0} \alpha_{i} \mathbf{c} \cdot \mathbf{x} - \frac{1}{n_0} \beta_{i}(c) (\mathbf{c} \cdot \mathbf{c} - \mathbf{c} \mathbf{c}) \cdot \nabla \mathbf{q}_{\text{asy}}(r)
\]

\( p_i(r) \) is the partial pressure of component \( i \), \( p_{i0} = p_i(0) \). In (19)

\[
\mathbf{x} = (1/T_0) \nabla T_{\text{asy}}(r)
\]

Substituting Eq. (19) into Eq. (7) it follows

\[
P_{\text{asy}} = P_{\text{asy}} - 2 \mu S_{\text{asy}}
\]
where $\mu$ is the coefficient of viscosity

$$\mu = \frac{1}{10 n_0} \left[ B_i(c) \left( e c - \frac{1}{3} c^2 \mathbf{1} \right), m_i(c) c - \frac{1}{3} c^2 \mathbf{1} \right],$$

(20)

an $\mathbf{S}$ denotes the rate-of-shear tensor. An in, if the factors of the inner products are tensors of the same order, the integrands of the bracket integrals contain the appropriate scalar products so that the bracket integrals are scalar quantities.

The spatial dependence of $q_{asy}$ is assumed to be nearly linearly. Then the vanishing divergence of $\mathbf{P}$ (7) leads to

$$\nabla p_{asy} = 0.$$

Therefore, $\mathbf{d}_j$ does not contain $\nabla p_{asy}$:

$$\mathbf{d}_j = \nabla \left[ p_{i,asy}(r)/p_{asy} \right],$$

where

$$\sum_j \mathbf{d}_j = 0.$$

The functions $D_j^i(c)$, $A_i(c)$ and $B_i(c)$ are the Chapman-Enskog diffusion, thermal conductivity and viscosity solutions defined in $^{15}$. For instance

$$L[B_i(c) \left( e c - \frac{1}{3} c^2 \mathbf{1} \right)] = -n_0 \left( m_i/k T_0 \right) \left( e c - \frac{1}{3} c^2 \mathbf{1} \right).$$

(21)

For calculating the slip coefficients and slip velocities it is considerably more convenient to introduce the modified Chapman-Enskog functions $^{14}$

$$\tilde{D}_j^i(c) = D_j^i(c) - \left( n_0 k/\lambda' \right) D_{Ti} A_i(c) \ (j = 1, \ldots, N),$$

$$\tilde{A}_i(c) = A_i(c) - \sum_j k_{Ti} D_j^i(c),$$

where diffusion coefficients $D_{ij}$, thermal diffusion coefficients $D_{Ti}$, partial or theoretical coefficient of thermal conductivity $\lambda'$, and thermal diffusion ratios $k_{Ti}$ are defined in $^{15}$.

These modified functions satisfy the relations

$$\tilde{D}_{ij} = \frac{1}{3 n_0} \int_{f_{i0}} \tilde{D}_j^i(c) c^2 \mathbf{e} \mathbf{d} e,$$

(22)

$$0 = \int_{f_{i0}} \tilde{A}_i(c) c^2 \mathbf{e} \mathbf{d} e = \frac{n_{i0}}{n_0} \left[ \tilde{D}_j^i(c) c, \left( \frac{m_j c^2}{2 k T_0} - \frac{5}{2} \right) c \right],$$

(23)

$$\tilde{\lambda} = \frac{k}{3 n_0} \left[ \tilde{A}_i(c) c, \left( \frac{m_i c^2}{2 k T_0} - \frac{5}{2} \right) c \right],$$

(24)

where

$$\tilde{D}_{ij} = D_{ij} - \left( n_0 k/\lambda' \right) D_{Ti} \ D_{Ti},$$

(25)

$$\tilde{\lambda} = \lambda' - n_0 k \sum_i k_{Ti} D_{Ti},$$

(26)

and

$$\tilde{D}_{ij} = \tilde{D}_{ij}, \quad \sum_i n_{i0} \tilde{D}_{ij} = 0.$$

$\tilde{\lambda}$ is seen to be the coefficient of thermal conductivity of the gas mixture $^{15}$.

Written with the modified functions the perturbation $\Phi_i^{(1)} (r, c)$ (19) takes the form

$$\Phi_i^{(1)} (r, c) = -\frac{1}{n_0} \sum_j \tilde{D}_j^i(c) c \mathbf{d}_j - \frac{1}{n_0} \tilde{A}_i(c) c \tilde{\mathbf{x}} - \frac{1}{n_0} B_i(c) \left( e c - \frac{1}{3} c^2 \mathbf{1} \right) \ldots \nabla q_{asy}(r),$$

(27)

where the modified gradients have been used as

$$\tilde{\mathbf{d}}_j = \mathbf{d}_j + \frac{\lambda'}{\lambda} k_{Ti} \left( \mathbf{x} + \frac{n_0 k}{\lambda'} \sum_i D_{Ti} \mathbf{d}_i \right),$$

(28)

$$\tilde{\mathbf{x}} = \frac{\lambda'}{\lambda} \mathbf{x} + \frac{n_0 k}{\lambda} \sum_i D_{Ti} \mathbf{d}_i.$$
With the modified quantities the diffusion velocities and heat flux take the simple forms
\[ \mathbf{u}_i - \mathbf{q}_{\text{asy}}(r) = - \sum_j D_{ij} \tilde{d}_j, \quad Q_{\text{c}'} / k T_0 = - (\lambda / k) \tilde{x}. \]

Furtheron the following relation results
\[ L[\tilde{A}_i(c) \mathbf{e}] = - n_0 \left( \frac{m_i c^2}{2 k T_0} - \frac{5}{2} \frac{n_0}{n_0} k T_i \right) \mathbf{c}. \quad (30) \]

V. Calculation of Inner Products

To find an approximate solution for the extrapolation \( q_{\text{asy}}(0) \) of the mass velocity to the wall and for the macroscopic temperature jump
\[ \varepsilon_t = [T_{\text{asy}}(0) - T_0] / T_0 \quad (31) \]
in the vicinity of the surface, the inner products of the perturbation \( \Phi_i \) [Eq. (1)] and of the asymptotic distribution \( \Phi_{i,\text{asy}} \) [Eqs. (17, 18, 27)] with some special functions are considered. Multiplication of \( m_i \mathbf{c} \mathbf{e} \) and of \( ((m_i c^2)/(2 k T_0) - 5/2) \mathbf{e} \) by \( \Phi_{i,\text{asy}} \) leads to
\[ [m_i \mathbf{c} \mathbf{e}, \Phi_{i,\text{asy}}(r, \mathbf{e})] = (p_{\text{asy}} - p_0) 1 - 2 \mu \mathbf{S}_{\text{asy}}, \quad (32) \]
and
\[ \left[ \left( \frac{m_i c^2}{2 k T_0} - \frac{5}{2} \right) \mathbf{c}, \Phi_{i,\text{asy}}(r, \mathbf{e}) \right] = - \lambda / k \tilde{x}, \quad (33) \]
whereby the identities (23), (24) have been used.

Next the gradients of the inner products of \( \tilde{A}_i(c) \mathbf{c} \mathbf{e} \) and \( B_i(c) (\mathbf{c} \mathbf{e} - \frac{1}{2} c^2 \mathbf{1}) \mathbf{e} \) with \( \Phi_i \) are calculated. With (3), the hermiticity of \( L \), and the Eqs. (30) and (21) it follows
\[ \nabla \cdot [\tilde{A}_i(c) \mathbf{c} \mathbf{e}, \Phi_i] = - n_0 \left[ \left( \frac{m_i c^2}{2 k T_0} - \frac{5}{2} \frac{n_0}{n_0} k T_i \right) \mathbf{c}, \Phi_i \right], \quad (34) \]
\[ \nabla \cdot [B_i(c) (\mathbf{c} \mathbf{e} - \frac{1}{2} c^2 \mathbf{1}) \mathbf{e}, \Phi_i] = - n_0 \left[ \frac{m_i}{k T_0} (\mathbf{c} \mathbf{e} - \frac{1}{2} c^2 \mathbf{1}), \Phi_i \right]. \quad (35) \]

Evaluation of (34) with the asymptotic distribution \( \Phi_{i,\text{asy}} \) instead of \( \Phi_i \) using the Eqs. (22) to (24), (26) and (29) leads to
\[ \nabla \cdot [\tilde{A}_i(c) \mathbf{c} \mathbf{e}, \Phi_{i,\text{asy}}] = n_0 (\lambda / k) \tilde{x}. \quad (36) \]
With \( \Phi_{i,\text{asy}} \) instead of \( \Phi_i \) (35) turns to
\[ \nabla \cdot [B_i(c) (\mathbf{c} \mathbf{e} - \frac{1}{2} c^2 \mathbf{1}) \mathbf{e}, \Phi_{i,\text{asy}}] = (2 n_0 / k T_0) \mu \mathbf{S}_{\text{asy}}. \quad (37) \]
Lastly it holds
\[ \left[ \left( - \frac{n_0}{n_0} k T_i \right) \mathbf{c}, \Phi_{i,\text{asy}} \right] = \frac{\lambda}{k} (\tilde{x} - \tilde{x} ), \quad (38) \]
and
\[ [B_i(c) \mathbf{c} \mathbf{e}, \Phi_{i,\text{asy}}] = \mu \frac{n_0}{k T_0} 3 \tilde{q}_{\text{asy}}(r) - \frac{1}{5 n_0} [B_i(c) c^4, \sum_j D_j(c) \tilde{d}_j + \tilde{A}_i(c) \tilde{v}], \quad (39) \]
where \( \tilde{w} \) denotes the symmetric part of the third-order tensor \( w \), and
\[ [\tilde{A}_i(c) \mathbf{c} \mathbf{e}, \Phi_{i,\text{asy}}] = n_0 \frac{\lambda}{k} T_{\text{asy}}(r) - T_0 - \frac{2}{15 n_0} [\tilde{A}_i(c) c^4, B_i(c)] \mathbf{S}_{\text{asy}}. \quad (40) \]
The relations (38) and (39) have been derived with the useful general integral theorem
\[ \int F(C) C C C C dC = \frac{1}{2} \int F(C) C^4 dC \tilde{1} \tilde{1}, \]
where \( F(C) \) is any function of \( C \), and \( \tilde{1} \) is the symmetric part of the fourth-order tensor \( \tilde{1} \), and with the relations
\[ \tilde{1} \cdot \mathbf{a} = \tilde{1} \mathbf{a}, \quad \tilde{1} \cdot w = \frac{3}{3} w + \frac{1}{3} \text{tr}(w), \]
where \( \mathbf{a} \) is any vector, \( w \) any second-order tensor, and \( \text{tr}(w) \) the trace (or divergence) of \( w \).
VI. Determination Equations

As in the Kramers problem the gas mixture far from the surface is maintained at a mass velocity \( \mathbf{q}_{asy}(\mathbf{r}) \) with constant direction parallel to the surface and constant gradient of \( q_{asy} \) normal to the plate. This direction of \( q_{asy} \) is chosen as the \( y \)-direction, so that

\[
\mathbf{S}_{asy} = \begin{bmatrix}
0 & \frac{1}{2} \frac{\partial q_{asy}}{\partial x} & 0 \\
\frac{1}{2} \frac{\partial q_{asy}}{\partial x} & 0 & 0 \\
0 & 0 & 0
\end{bmatrix}.
\]

Moreover, the temperature gradient of the gas mixture far from the plate is maintained constant, so that \( \frac{\partial T_{asy}(\mathbf{r})}{\partial x} \) is independent of \( x \). \( \nabla T_{asy}(\mathbf{r}) \) may have any direction with normal (\( x \)-) and parallel (\( y \-) and \( z \)-) components.

Furthermore, in the whole gas, including the Knudsen-layer, the dependences of the perturbation \( \Phi_i \) \((i = 1, \ldots, N)\) upon the coordinates \( y \) and \( z \) parallel to the surface are assumed to be small enough, so that the five expressions \( \nabla_i \mathbf{P} \), \( \nabla_i \mathbf{Q}' \), \( \nabla_i \mathbf{u}_i \), \( \nabla_i [A_i(c) \mathbf{c} c_z, \Phi_i] \), and

\[
\nabla_i [B_i(c)(\mathbf{c} c_y - \frac{1}{2} c^2 \mathbf{i}_y) c_z, \Phi_i]
\]

can be neglected, or are at least independent of \( x \) (analogous to Welander's original assumption for the temperature jump calculation). Hereby \( \nabla_i \) denotes the part of the divergence arising from differentiations with respect to coordinates parallel to the surface,

\[
\nabla_i = i_y \frac{\partial}{\partial y} + i_z \frac{\partial}{\partial z},
\]

and \( i_x, i_y, i_z \) denote the unit vectors in \( x, y, z \)-direction.

In this case the divergences of the pressure tensor \( \mathbf{P} \), the heat flux vector \( \mathbf{Q}' \), the mean particle velocity \( \mathbf{u}_i \), and the vectors \( [A_i(c) \mathbf{c} c_z, \Phi_i] \) and \( [B_i(c)(\mathbf{c} c_y - \frac{1}{2} c^2 \mathbf{i}_y) c_z, \Phi_i] \) can be replaced by the sum of their parts \( i_x (\frac{\partial}{\partial x}) \) and quantities independent of \( x \), for example

\[
\nabla \cdot \mathbf{u}_i = \frac{\partial}{\partial x} u_{ix} + \text{const}.
\]

Then from the discussions at Eqs. (7) and (9) it follows at first that the derivation

\[
\frac{\partial}{\partial x}[m_i \mathbf{c} c_z, \Phi_i(\mathbf{r}, \mathbf{c})]
\]

of the pressure tensor normal component \( i_x \mathbf{P}^{(i)} \), and that one

\[
\frac{\partial}{\partial x} \left[ \left( \frac{m_i c^2}{2} - \frac{5}{2} k T_0 \right) c_z, \Phi_i(\mathbf{r}, \mathbf{c}) \right]
\]

of the heat flux vector normal coordinate \( Q'_{cx} \) are independent of \( x \) and can be evaluated by \( \Phi_{i,asy} \).

The Eqs. (32), (33) lead to

\[
[m_i \mathbf{c} c_z, \Phi_i(\mathbf{r}, \mathbf{c})] = (p_{asy} - p_0) i_x - 2 \mu \mathbf{S}_{asy} \cdot i_x,
\]

\[
\left[ \left( \frac{m_i c^2}{2} - \frac{5}{2} k T_0 \right) c_z, \Phi_i(\mathbf{r}, \mathbf{c}) \right] = - \frac{\lambda}{k} z_x,
\]

and to

\[
[m_i(\mathbf{c} c - \frac{1}{2} c^2 \mathbf{1}), \Phi_i(\mathbf{r}, \mathbf{c})] \cdot i_x = - 2 \mu \mathbf{S}_{asy} \cdot i_x.
\]

The shear stress \( y \)-coordinate from (43) is

\[
i_y \cdot [m_i(\mathbf{c} c - \frac{1}{2} c^2 \mathbf{1}), \Phi_i(\mathbf{r}, \mathbf{c})] \cdot i_x = - \frac{\partial}{\partial x} q_{asy}.
\]

It follows from (44) and (35) that \( i_y \cdot [\nabla \cdot (B_i(c)(\mathbf{c} c - \frac{1}{2} c^2 \mathbf{1}) \mathbf{c}, \Phi_i)] \cdot i_x \) is independent of \( x \). Hence \( \frac{\partial}{\partial x}[B_i(c) c_z^2 c_y, \Phi_i] \) is independent of \( x \) and \( [B_i(c) c_z^2 c_y, \Phi_i] \) can be evaluated by the use of the asym-
ptotic solution. With Eqs. (37), (39) the result is

\[ [B_i(c) c_x^2 c_y, \Phi_i(r, c)] = \frac{n_0}{k T_0} \mu \frac{\partial q_{a_s}}{\partial x} x + \frac{n_0}{k T_0} \mu q_{a_s}(0) - \frac{1}{15 n_0} [B_i(c) c^4, \sum_j \tilde{D}_j \tilde{d}_{jy} + \tilde{A}_i(c) \tilde{z}_y]. \]  

(45)

It follows from before Eq. (4) and the discussions at the beginning of Section VI. that the normal component \( u_{ix} \) of the mean particle velocity \( u_i \) of sort \( i \) can be evaluated by the use of \( \Phi_{i, a_s} \). The same is valid for the expression \([(-n_0/n_0) k T_0 c_x, \Phi_i(r, c)]\). Therefore, the Eqs. (42), (38) lead to

\[ \left[ (m_i c^2 - \frac{5}{2} - \frac{n_0}{k T_0} c_x, \Phi_i(r, c) \right] = \frac{\lambda}{k} k \tilde{z}_x. \]  

(46)

It follows from (45) and (34) that \( \nabla \cdot [\tilde{A}_i(c) c_x, \Phi_i] \) is independent of \( x \). Hence, \( \partial / \partial x [\tilde{A}_i(c) c_x^2, \Phi_i] \) is independent of \( x \) so that \( [A_i(c) c_x^2, \Phi_i] \) is linear in \( x \) and can also be calculated by the use of \( \Phi_{i, a_s} \). The result is, using Eqs. (36), (40)

\[ [\tilde{A}_i(c) c_x^2, \Phi_i(r, c)] = n_0 \frac{\lambda}{k} k \tilde{x}_x x + n_0 \frac{\lambda}{k} \frac{T_{a_s}(r) - T_0}{T_0}. \]  

(47)

According to the assumptions at the beginning of Section VI. \( \partial q_{a_s}(x) / \partial x, \tilde{x}_y, d_{jy} \) and \( \tilde{z}_y \) are constant.

From (44), (45), (42), (47) and (31) the following four Eqs. at the wall at \( r = 0 \) arise

\[ [m_i c_y c_x, \Phi_i(0, c)] = -\mu \frac{\partial}{\partial x} q_{a_s}(x), \]  

(48)

\[ [B_i(c) c_x^2 c_y, \Phi_i(0, c)] = \frac{n_0}{k T_0} \mu q_{a_s}(0) - \frac{1}{15 n_0} [B_i(c) c^4, \sum_j \tilde{D}_j \tilde{d}_{jy} + \tilde{A}_i(c) \tilde{z}_y], \]  

(49)

\[ \left[ \left( m_i c^2 - \frac{5}{2} \right) c_x, \Phi_i(0, c) \right] = \frac{\lambda}{k} \tilde{z}_{x0}, \]  

(50)

\[ [\tilde{A}_i(c) c_x^2, \Phi_i(0, c)] = n_0 (\lambda / k) \epsilon_t, \]  

(51)

where \( \tilde{x}_{x0} \) is the value of \( \tilde{x}_x \) at \( x = 0 \).

VII. Maxwell's Assumption and Modified Maxwell-Method

Maxwell's arguments amount to assuming

\[ \Phi_i(r = 0, c) = \Phi_{i, a_s}(r = 0, c) \quad (c_x < 0) \]

for the (first order correction of the) velocity distribution function of the molecules approaching the wall. Therefore, with the function

\[ \eta(c_x) = \begin{cases} 1, & \text{for } c_x > 0, \\ 0, & \text{for } c_x < 0, \end{cases} \]

and the boundary condition (13) the whole distribution near the wall at \( r = 0 \) can be written

\[ \Phi_i(0, c) = [\eta(-c_x) + \eta(c_x) A_i] \Phi_{i, a_s}(0, c). \]  

(52)

Inserting the ansatz (52) into Eq. (48) gives the macroscopic slip velocity, into Eq. (50) the macroscopic temperature jump.

The modified Maxwell-method, first used by Loyalka, and analogously applied for the cases treated here, consists in using another distribution function instead of (52). For the calculation of slip velocity it differs from (52) only by containing an unknown constant \( a_p \) instead of \( q_{a_s}(0) \), for the calculation of temperature jump it differs from (52) only by containing the unknown constant \( a_T \) instead of \( \epsilon_t \) in \( g_i \) (18). The two unknowns \( q_{a_s}(0) \) and \( a_p \) are calculated solving the system of Eqs. (48), (49); correspondingly \( \epsilon_t \) and \( a_T \) are calculated with the Eqs. (50), (51).
The results are of the form
\[ q_{\text{asy}}(0) = \frac{k T_0}{c_x \eta(c_x) (1 - A_i)} \left\{ \left[ \frac{c_x^2}{2 k T_0} - \frac{5}{2} \right] B_i(c) c_y (1 - A_i) \right\} \varepsilon_t + \frac{1}{n_0} \left[ B_i(c) c_x c_y (c_y A_i) \cdot \left( \sum_j \bar{D}_j(c) \tilde{d}_j + \tilde{A}_i(c) \tilde{x}_0 \right) \right] \]
\[ + \frac{1}{n_0} \left[ B_i(c) c_x c_y (c_y (1 - A_i) B_i(c) c_x c_y) \right] \frac{\partial q_{\text{asy}}(x)}{\partial x} \] (55)

The modified Maxwell-method leads to
\[ q_{\text{asy}}(0) = \frac{k T_0}{\mu n_0} \left\{ \left[ B_i(c) c_x^2 c_y, \eta(c_x) A_i \left( \frac{c_x^2}{2 k T_0} - \frac{5}{2} \right) \right] \varepsilon_t + \frac{1}{n_0} \left[ B_i(c) c_x c_y (c_y A_i) \cdot \left( \sum_j \bar{D}_j(c) \tilde{d}_j + \tilde{A}_i(c) \tilde{x}_0 \right) \right] \]
\[ + \left[ B_i(c) c_x c_y (c_y (1 - A_i) B_i(c) c_x c_y) \right] \frac{q_{\text{asy,M}}(0)}{k T_0} \right\} \]
\[ + \frac{1}{n_0} \left[ \bar{A}_i(c) c_x^2, \eta(c_x) \left( c_x i_x - A_i e \right) \cdot \left( \sum_j \bar{D}_j(c) \tilde{d}_j + \tilde{A}_i(c) \tilde{x}_0 \right) \right] \varepsilon_{t,M} \] (57)

In (53) \( \zeta \) is the usual velocity-slip coefficient, the sum of the second and third summand is the sum of diffusion slip and thermal creep velocity, and the first summand is a certain slip velocity caused by a macroscopic temperature jump and vanishing for isotropic surfaces, as will be seen later.

\( \tilde{\zeta}_i \) in (54) is the (modified) temperature-slip coefficient, the other slip coefficients \( \zeta_{i\mu} \) again vanish for isotropic surfaces, as shall be discussed in the following.

Inserting (54) into (53), the macroscopic slip velocity \( q_{\text{asy}}(0) \) can be represented, as usually, depending only on the forces \( \tilde{d}_j, \tilde{x}_0 \) and \( \partial q_{\text{asy}}(x) / \partial x \); conversely the macroscopic temperature jump \( \varepsilon_t \) by inserting (53) into (54).

According to Maxwell’s assumption (index M) the equations for the slip velocity and temperature jump are
\[ q_{\text{asy,M}}(0) = \frac{k T_0}{c_x \eta(c_x) (1 - A_i)} \left\{ \left[ \frac{c_x^2}{2 k T_0} - \frac{5}{2} \right] B_i(c) c_y (1 - A_i) \right\} \varepsilon_t + \frac{1}{n_0} \left[ B_i(c) c_x c_y (c_y A_i) \cdot \left( \sum_j \bar{D}_j(c) \tilde{d}_j + \tilde{A}_i(c) \tilde{x}_0 \right) \right] \]
\[ + \frac{1}{n_0} \left[ B_i(c) c_x c_y (c_y (1 - A_i) B_i(c) c_x c_y) \right] \frac{\partial q_{\text{asy}}(x)}{\partial x} \] (58)
For the derivation of these four equations the reciprocity relation (12) the definitions (20) and (24), and the first equation (23) were used. The slip coefficients in (53), (54) follow directly from the expressions in (55) to (58).

VIII. Introduction of Accommodation Coefficients

Corresponding to 14,15 for the modified Chapman-Enskog functions the ansatz is made

\[ \tilde{D}_i(c) = \frac{m_i}{2kT_0} \sum_{p=0}^{n-1} \tilde{a}_{i,p}^{(n)} S_i^{(p)} \left( \frac{m_i c^2}{2kT_0} \right), \]

\[ \tilde{A}_i(c) = -\frac{m_i}{2kT_0} \sum_{p=0}^{n-1} \tilde{a}_{i,p}^{(n)} S_i^{(p)} \left( \frac{m_i c^2}{2kT_0} \right), \]

\[ B_i(c) = n_0 \frac{m_i}{(kT_0)^2} \frac{\mu_i}{n_{i0}}, \]

where \( S_i^{(p)} \) denotes the Sonine polynomial of order \( n \) and index \( v \). In a first order approximation it follows

\[ \tilde{D}_i(c) = 2n_0 \frac{m_i}{2kT_0} \tilde{D}_{ij}, \] (59)

\[ \tilde{A}_i(c) = -\frac{4}{5} n_0 \frac{m_i}{2kT_0} \frac{\lambda_i}{k n_0} \left( \frac{5}{2} - \frac{m_i c^2}{2kT_0} \right), \] (60)

\[ B_i(c) = n_0 \frac{m_i}{(kT_0)^2} \frac{\mu_i}{n_{i0}}, \] (61)

where \( \tilde{D}_{ij}, \lambda_i \) and \( \mu_i \) are the first order approximations of the diffusion coefficients, the thermal conductivity, and the viscosity of the species \( i \), with \( \lambda = \Sigma_i \lambda_i, \mu = \Sigma_i \mu_i \).

The functions (59) to (61) are inserted into the inner products of Eqs. (55) to (58). The results are represented in terms of the so-called Knudsen accommodation coefficients, defined by Kuščer 17. The generalization of that definition for the case of possibly anisotropic surfaces is performed with the R-operator:

\[ Rh(v) = \left\{ \begin{array}{ll} h(-v) & \text{for anisotropy of the surface,} \\ h(v_R) & \text{for isotropy of the surface,} \end{array} \right. \]

where \( h \) is an arbitrary function of the dimensionless velocity \( v \), and \( v_R \) is the velocity reflected on the surface:

\[ v_R = (-v_x, v_y, v_z). \]

The operator \( \hat{P}_i \) is defined by

\[ \hat{P}_i h(v) = \int R P_i(v \to v') h(v') dv' \quad (v_z > 0). \]

\( \hat{P}_i \) is connected with the scattering operator \( A_i \) (14) by the equation

\[ \hat{P}_i \Phi(0, v) = A_i R \Phi(0, v) \quad (v_z > 0), \]

following from the reciprocity relation. The application of the operator \( \hat{P}_p \) for perfect accommodation is denoted by a triangular bracket.

\[ \hat{P}_p h = \frac{2}{\pi} \int u_z' \exp (-v'^2) h(v') dv' = \langle h \rangle. \] (62)

In consequence of the reciprocity \( \hat{P}_i \) is Hermitian with respect to the inner product defined by the average (62):

\[ \langle h_1 \hat{P}_i h_2 \rangle = \langle (\hat{P}_i h_1) h_2 \rangle, \]

where \( h_1, h_2 \) are arbitrary functions.

The definition of the general accommodation coefficient for the species \( i \) and the dynamic quantity \( Q_j(v) \) runs

\[ \alpha_{j,i} = -\int v_z Q_j(v_R) f_i^-(v) dv \]

is the normal coordinate of the \( Q_j(v_R) \)-flux of the incident \( i \)-particles with the velocity distribution \( f_i^-(v) \),

\[ \Phi_{j,i}^+ = \int v_z Q_j(v) f_i^+(v) dv \]

the corresponding normal coordinate of the \( Q_j(v) \)-flux of the reflected \( i \)-particles with the velocity distribution \( f_i^+(v) \), and \( \Phi_{j,i}^+ \) the value of \( \Phi_{j,i}^+ \) for perfect accommodation.

Multiplication of \( Q_j \) by a constant does not affect \( \alpha_{j,i} \), and because of particle conservation (11) addition of a constant is irrelevant too.

Therefore, all \( Q_j \) can be modified in such a way as to make \( \langle Q_j \rangle = 0 \).

Then, if the incident distribution is written

\[ R f_i^-(v) = \frac{2C_i}{\pi} e^{-v'^2} [1 + g_i(v)] \quad (v_z > 0) \] (63)

\( (C_i: \text{constant}) \), the general accommodation coefficient turns to

\[ \alpha_{j,i}(g_j) = 1 - \frac{\langle g_j \hat{P}_i Q_j \rangle}{\langle (R g_R) Q_j \rangle}, \] (64)
where the reflected function $g_{IR}$ is defined by

$$g_{IR}(v) = g_l(v_R).$$

The Knudsen accommodation coefficient $a_{jk,i}$ is the special case of (64) for

$$g_l(v) = e Q_k(v)$$

($e$: constant), so that

$$a_{jk,i} = a_l(Q_k) = 1 - \frac{(Q_k P_l Q_l)}{(R Q_{IR} Q_l)}.$$

As quantities $Q_k$ all the polynomials from the 13-moments method of Grad are used, supplemented by $v^4$:

- $Q_5 = v_x v_y$, $Q_{10} = v_x v_y^2 - \frac{3}{2} v^2 x$, $Q_2 = v_y$, $Q_4 = v_x^2 - 2$, $Q_6 = v_x^2 - \frac{3}{2}$

**IX. Results**

With Maxwell's assumption the results for the slip coefficients are, with the abbreviations

$$I_i = n_{i0} \sqrt{\frac{k T_0}{2 \pi m_i}},$$

for the flux of $i$-particles impinging the surface,

$$A_{22} = \sum_i m_i I_i a_{22,i},$$

$$A_{44} = \sum_i I_i a_{44,i},$$

and

$$Z_{ji,k} = \langle Q_j P_k Q_k \rangle, \quad \zeta_{i,M} = \frac{1}{2 A_{22}} \sum_i \mu_i (2 - a_{25,i}), \quad (72)$$

$$\zeta_{i,q,M} = -\frac{1}{2 V \pi A_{44}} \sum_i n_{i0} Z_{24,i}, \quad (73)$$

$$\tilde{\zeta}_{i,q,M} = 0, \quad (74)$$

$$\tilde{\zeta}_{i,k,M} = \frac{1}{4 A_{44}} \sum_i \frac{\lambda_i}{k} \left[ 2 - \frac{3}{2} (3 a_{4,10,i} - a_{4,14,i}) \right], \quad (75)$$

$$\tilde{\zeta}_{i,y,M} = \frac{1}{2 V \pi A_{44}} \sum_i \frac{\lambda_i}{k} \left( \frac{2}{3} Z_{4,14,i} - Z_{24,i} \right), \quad (76)$$

$$\tilde{\zeta}_{i,z,M} = \frac{1}{2 V \pi A_{44}} \sum_i \frac{\lambda_i}{k} \left( \frac{2}{5} Z_{4,12,i} - Z_{34,i} \right), \quad (77)$$

$$\tilde{\zeta}_{i,x,M} = -\frac{1}{4 A_{44}} \sum_i \frac{\mu_i}{p_{i0}} I_i Z_{45,i}. \quad (78)$$

The results gained with the modified Maxwell-method are, with the abbreviations

$$A_{25} = \frac{1}{2} \sum_i \mu_i (2 - a_{25,i}),$$

$$A_{44} = \frac{1}{4} \sum_i \lambda_i (4 + a_{14,i} - 3 a_{4,10,i})$$

$$= \frac{1}{2} \frac{k}{\lambda} A_{44} \tilde{\zeta},$$

$$\zeta_i = A_{25} \zeta_{i,M} + 2 \sum_i \frac{\mu_i}{\mu} I_i Z_{24,i}, \quad (79)$$

$$\tilde{\zeta}_i = 0, \quad (80)$$

$$\tilde{\zeta}_{ijy} = A_{25} \tilde{\zeta}_{ijy,M} + \frac{1}{2} \sum_i \frac{\mu_i}{\mu} a_{25,i} \tilde{D}_{ij}, \quad (81)$$

$$\tilde{\zeta}_{ijz} = A_{25} \tilde{\zeta}_{ijz,M} + \frac{2}{V \pi} \sum_i \frac{\mu_i}{\mu} Z_{35,i} \tilde{D}_{ij}, \quad (82)$$

$$\tilde{\zeta}_{i,x} = A_{25} \tilde{\zeta}_{i,x,M} + \frac{2}{V \pi} \sum_i \frac{\mu_i}{\mu} \lambda_i \frac{1}{k} \left( \frac{2}{5} Z_{5,10,i} - Z_{15,i} \right), \quad (83)$$

$$\tilde{\zeta}_{i,y} = A_{25} \tilde{\zeta}_{i,y,M} + \frac{1}{10} \sum_i \frac{\mu_i}{\mu} \lambda_i \frac{1}{k} \left( 7 a_{11,5,i} - 5 a_{25,i} \right), \quad (84)$$

$$\tilde{\zeta}_{i,x} = A_{25} \tilde{\zeta}_{i,x,M} + \frac{2}{V \pi} \sum_i \frac{\mu_i}{\mu} \lambda_i \frac{1}{k} \left( \frac{2}{5} Z_{5,12,i} - Z_{35,i} \right), \quad (85)$$

$$\tilde{\zeta}_i = A_{25} \tilde{\zeta}_i + \frac{1}{\pi} \sum_i \frac{\mu_i^2}{\mu m_i I_i} (2 - a_{55,i}), \quad (86)$$

$$\tilde{\zeta}_{iq} = A_{14} \tilde{\zeta}_{iq,M} + 2 \sum_i \frac{\lambda_i}{\lambda} \frac{m_i I_i}{p_{i0}} (Z_{12,i} - \frac{2}{5} Z_{2,10,i}), \quad (87)$$

$$\tilde{\zeta}_{i,y} = A_{14} \tilde{\zeta}_{i,y,M} + 2 \sum_i \frac{\lambda_i}{\lambda} \frac{m_i I_i}{p_{i0}} (Z_{12,i} - \frac{2}{5} Z_{2,10,i}), \quad (87)$$
\[
\begin{align*}
\zeta_{ijx} &= 0, \quad (88) \\
\zeta_{i,jy} &= \frac{\sqrt{2}}{V} \sqrt{\frac{1}{\pi k T_0}} \sum_i \sqrt{m_i} \frac{\lambda_i}{\lambda} \left( \frac{Z_{2,10,i} - Z_{12,i}}{\frac{2}{5} Z_{2,10,i} - Z_{12,i}} \right) \bar{D}_{ij}, \quad (89) \\
\zeta_{i,jz} &= -\frac{\sqrt{2}}{V} \sqrt{\frac{1}{\pi k T_0}} \sum_i \sqrt{m_i} \frac{\lambda_i}{\lambda} \left( \frac{Z_{3,10,i} - Z_{13,i}}{\frac{2}{5} Z_{3,10,i} - Z_{13,i}} \right) \bar{D}_{ij}, \quad (90) \\
\zeta_{ix} &= A_{14} \zeta_{i,JM} + \frac{1}{\pi} \sum_i \lambda_i \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \left( \frac{26}{25} - \left( 1 - \frac{\pi}{4} \right) a_{11,i} \right) + \frac{8}{5} \left( 3 - \frac{\pi}{4} \right) a_{10,i} \left( \frac{26}{25} - \frac{\pi}{4} \right) a_{10,10,i}, \quad (91) \\
\zeta_{iy} &= A_{14} \zeta_{i,JM} + \frac{1}{\pi} \sum_i \lambda_i \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \left( Z_{12,i} - \frac{2}{5} Z_{111,i} \right) - \frac{8}{5} Z_{2,10,i} + \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \left( Z_{13,i} - \frac{3}{5} Z_{12,i} \right) - \frac{2}{5} Z_{3,10,i} + \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \left( Z_{13,i} - \frac{3}{5} Z_{12,i} \right), \quad (92) \\
\zeta_{iz} &= A_{14} \zeta_{i,JM} + \frac{\sqrt{2}}{\pi} \sum_i \lambda_i \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \frac{\mu_i}{\sqrt{m_i k T_0}} \left( Z_{12} - \frac{3}{5} Z_{5,10,i} \right). \quad (93) \\
\zeta_{i,Jy} &= \frac{1}{4} \sum_i \lambda_i \left( 2 - a_{22,i} \right) \left( \frac{1}{2} \sum_i \lambda_i \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \left( Z_{12,i} - \frac{3}{5} Z_{12,i} \right) \right) \left( 2 \left( 1 - \frac{\pi}{4} \right) a_{11,i} \right) + \frac{8}{25} \sum_i \lambda_i \left( 2 - a_{22,i} \right) \left( 13 - \frac{3}{5} \left( 1 - \frac{\pi}{4} \right) a_{11,i} \right) + 10 \left( 3 - \frac{\pi}{4} \right) a_{10,i} \left( 24 - \frac{3}{5} \left( 1 - \frac{\pi}{4} \right) a_{10,i} \right), \quad (94)
\end{align*}
\]

The slip coefficients \( \zeta_{i,JM}, \zeta_{i,Jy}, \zeta_{i,Jz}, \zeta_{i,Jz} \) vanish since there is no \( i \)-particle flux through the surface, i.e., \( u_{ix} - q_{asy} = 0 \).

The expression \( Z_{ik,i} \) is proportional to the \( x \)-coordinate \( \Phi_{ik} \) of the \( Q_k \)-flux of the reflected \( i \)-particles, if the perturbation \( g_i \) of the incident distribution (63) is proportional to \( Q_j \). All the \( Z_{ik,i} \) in the equations (65) to (94) vanish, if the surface is isotropic, i.e., if the scattering kernel \( P_i \) is invariant under rotations about the \( x \)-axis. But already invariance of \( P_i \) with respect to rotations through \( 180^\circ \) about the \( x \)-axis is sufficient for the vanishing of almost all \( Z_{ik,i} \) in these equations, with the only exception of the four terms \( Z_{23,i}, Z_{2,12,i}, Z_{35,i}, Z_{3,12,i} \). These four terms cause non-vanishing slip coefficients \( \zeta_{ijz} \) and \( \zeta_{ixz} \), and a change of the slip velocity \( q_{asy} \) due to the \( z \)-component of the temperature gradient \( \nabla T_{asy} \) (together with the mass flow in \( y \)-direction). The change of the thermal creep velocity occurs also in the special case of a simple gas. \( Z_{ik,i} \) vanishes if \( P_i \) is invariant under rotations through \( 90^\circ \) about the \( x \)-axis.

The four most important slip coefficients can be written in the following form.

Velocity-slip coefficient.
\[
\zeta = \frac{\sum_i \lambda_i (2 - a_{25,i})}{2 \mu \sum_i \lambda_i} \left[ \frac{1}{2} \sum_i A_{25,i} \left( 1 - \frac{\pi}{4} \right) a_{11,i} + \frac{\pi}{2} \sum_i \lambda_i \left( 2 - a_{22,i} \right) \left( 13 - \frac{3}{5} \left( 1 - \frac{\pi}{4} \right) a_{11,i} \right) + 10 \left( 3 - \frac{\pi}{4} \right) a_{10,i} \left( 24 - \frac{3}{5} \left( 1 - \frac{\pi}{4} \right) a_{10,i} \right) \right]. \quad (95)
\]

Modified temperature-slip coefficient.
\[
\tilde{\zeta}_{ix} = \frac{1}{4} \sum_i \lambda_i \left( 2 - a_{14,i} \right) \left( \frac{1}{2} \sum_i \lambda_i \frac{2}{5} \frac{1}{k \lambda} \frac{1}{I_i} \left( Z_{12,i} - \frac{3}{5} Z_{12,i} \right) \right) \left( 2 \left( 1 - \frac{\pi}{4} \right) a_{11,i} \right) + \frac{8}{25} \sum_i \lambda_i \left( 2 - a_{22,i} \right) \left( 13 - \frac{3}{5} \left( 1 - \frac{\pi}{4} \right) a_{11,i} \right) + 10 \left( 3 - \frac{\pi}{4} \right) a_{10,i} \left( 24 - \frac{3}{5} \left( 1 - \frac{\pi}{4} \right) a_{10,i} \right), \quad (96)
\]

Modified thermal creep coefficient.
\[
\tilde{\zeta}_{iy} = \frac{1}{2} \sum_i \lambda_i \left[ \mu_i \left( 7 a_{3,11,i} - 5 a_{25,i} \right) + m_i I_i \left( 6 a_{3,11,i} - 5 a_{22,i} \right) \sum_k \mu_k \left( 2 - a_{25,k} \right) \right]. \quad (97)
\]

Modified diffusion-slip coefficient.
\[
\tilde{\zeta}_{iz} = \frac{1}{2} \mu \left[ \mu_i \left( 7 a_{3,11,i} - 5 a_{25,i} \right) + m_i I_i \left( 6 a_{3,11,i} - 5 a_{22,i} \right) \sum_k \mu_k \left( 2 - a_{25,k} \right) \right] \bar{D}_{ij}. \quad (98)
\]

For the special case of a simple gas the expressions (95), (96) turn to those given by Kline and Kuscer 10, 17, as directly can be seen.

The velocity slip coefficient \( \zeta \) mainly depend on the Knudsen accommodation coefficients \( a_{22,i} \) of tangential momentum, the modified temperature-slip coefficient \( \tilde{\zeta}_{ix} \) mainly on the a.c.s \( a_{44,i} \) of
energy. These a.c.s, and the radiometric a.c.s \( a_{14,i} \) have been measured under free molecular flow conditions by several authors, as discussed in 17. Also ideas for measuring the a.c.s. \( a_{11,i} \) of normal momentum, and the higher order a.c.s \( a_{25,i} + a_{4,10,i} \), \( a_{1,10,i} \), and \( a_{2,11,i} \) can be given, suggested by their definitions 17. Methods of measurement can also be constructed for all those fluxes \( Z_{jk,i} \) with \( j \leq 4 \) or \( k \leq 4 \) (or \( j \) and \( k \) not greater than four).

The higher order a.c.s \( a_{55,i} \), \( a_{10,10,i} \), \( a_{55,11,i} \), and the higher order fluxes \( Z_{jk,i} \) with \( j > 4 \) and \( k > 4 \) can be evaluated only indirectly. Under free molecular flow conditions all these coefficients can be gained measuring the gas-surface scattering kernel \( P_{ij}(c'i \rightarrow c) \) in molecular beam experiments, and calculating the corresponding moments of \( P_{ij} \). Less expensive is the introduction of models for \( P_{ij} \) having the general physical properties [non-negativity, normalization (11) and reciprocity (12)] and containing parameters that are intended for fitting experimental data 20.

But the results obtained in such a way cannot be used in all cases for the slip flow regime since the state of the surface, especially adsorption, depends on gas density. During the re-entry of a space vehicle, however, there exist slip flow conditions within the pressure region of \( 10^{-4} \) mm Hg \( \leq p \leq 10^{-2} \) mm Hg 21. Furtheron, investigations carried out recently by Seidl and Scherber 22 seem to indicate that the adsorption state for some technical surfaces does not change within the above mentioned pressure region. Therefore, the values of the Knudsen a.c.s measured in this pressure region, and the results of molecular beam experiments (performed at \( 10^{-5} \) mm Hg \( \leq p \leq 10^{-4} \) mm Hg) can be used for the calculation of the coefficients (79) to (94) for the slip flow phase of the re-entry process.

**X. Binary Gas-Mixture**

In a binary gas mixture only one independent diffusion coefficient \( \tilde{D}_{11} \) appears. Therefore, in the case of a binary gas-mixture some of the expressions in Sect. IX take a special form, because of

\[
\tilde{\zeta}_{1y} = 1 - \frac{1}{A_{22}} m_1 I_1 \left( a_{22,1} - a_{22,2} \right) \left( \frac{m_1}{m_2} \right)^2 \tilde{D}_{11} ,
\]

So, for a binary gas mixture the Eqs. (67), (68) turn to

\[
\tilde{\zeta}_{1y} = \frac{1}{A_{22}} m_1 I_1 \left( a_{22,1} - a_{22,2} \right) \left( \frac{m_1}{m_2} \right)^2 \tilde{D}_{11} ,
\]

The Eqs. (81), (98) are for that case

\[
\tilde{\zeta}_{1y} = \frac{1}{A_{22}} m_1 I_1 \left( a_{22,1} - a_{22,2} \right) \left( \frac{m_1}{m_2} \right)^2 \tilde{D}_{11} ,
\]

**XI. Acknowledgements**

The authors want to express their sincere gratitude to Prof. I. Kuscher for many enlightening discussions.
